

Jelaxon

Alternative to Restylane

What is Jelaxon?

Through a technology called Biotransformation, a component found in Royal Jelly derived from Honey Bee has been isolated.

How does Jelaxon work?

Instantly inflating skin and lip tissue causing hyper hydration. This in turn causes dramatic plumping to targeted areas. Once in the skin/lips Jelaxon works by creating volume. Within 5-10 minutes it immediately adds volume, lifting up and smoothing out unwanted wrinkles and plumping up the lips.

Which areas of the face can be treated with Jelaxon?

Jelaxon can be used for smoothing out folds and wrinkles, lip volume enhancements and shaping facial contours. The most common areas are the glabellar lines (between the eyebrows), the nasolabial folds (from the root of the nose to the angle of the mouth) and the lips, although other sites can also be treated. Very superficial or very deep wrinkles may be difficult to correct

What will I look like after the treatment?

Immediately after the treatment, you can expect NO redness, swelling, tenderness, or itching sensation to the treated area. After a lip treatment, the lips WILL NOT become swollen and look somewhat uneven.

Are there any side-effects associated with Jelaxon?

YES, In 20– 30 minutes you will see a dramatic smoothing out folds and wrinkles, lip enhancements and shaping facial contours. NO swelling, redness and tenderness will occur.

How long do the results last?

Approximately 24-36 hours.

How does Jelaxon price compare to Restylane?

One injection of Restylane is approximately 300 dollars and up.

Summary

Several Hyaluronic Acid-based filler gels are available from your dermatologist, which are injected into the skin. They effectively add volume to lips, as well as drastically lift and smooth wrinkles and skin creases. Jelaxon does it without the need for needles. Apply to deep lines or depressed scars every morning or as needed. Follow with your regular skin treatment products as usual.
